

ABSTRACT

The development of technology and information systems has become common in the application of agencies in the fields of government, economy, and industry. In the current era of technology, human resources who have the ability will experience change, improvement, and progress. Information systems play a very important role in the world of industry, economy and government. Therefore, experts are needed for this field. An internet-based information system will facilitate various parties external to the village and from within the village who want to know about the village. The form of the village information system used is website-based. A website is a collection of pages containing content that can only be accessed using the internet. The village information system is a tool used in the application of technology to improve village services and quality. Through this tool, the village can interact with various related parties, such as other villages, sub-districts, and agencies within an area. By utilizing one of these technologies, the community and external agencies can interact with each other easily. The village can also expose important information that can be known by the community and external agencies. Such as village profiles, village organizational structures, village area population data, village agendas, village news, and village contacts.
